

Smart Event Management Platform

Organizing large-scale events like hackathons, tech fests, and conferences currently requires juggling multiple disjointed platforms for registration, attendee verification, team formation, announcements, judging, and live tracking. This fragmented workflow creates administrative overhead, delays, and poor experience for both organizers and participants.

The Challenge

Design and build a unified, real-time Smart Event Management Platform that consolidates the end-to-end event lifecycle into a single interactive dashboard.

Key Features & Requirements

Registration & Attendee Check-in: Streamlined registration system that generates unique QR codes for fast on-site or virtual attendance scanning and verification.

Smart Team Formation: Dynamic matchmaking or discovery portal allowing individual participants to find teammates based on skills, roles, and project interests.

Broadcast & Announcement Center: Real-time push notifications or live updates feed for schedule changes, venue alerts, and critical announcements.

Interactive Judging Portal: Dedicated view for judges to evaluate submissions against defined rubrics, leave structured feedback, and submit scores securely.

Live Leaderboard & Analytics: Dynamic leaderboard displaying real-time rankings and aggregate scores, alongside an organizer analytics view for attendance and engagement tracking.

Target Deliverables

System Architecture / UX Wireframes: Clear visualization of the multi-role flow (Participant, Judge, Organizer).

Interactive Prototype / App Interface: A functional dashboard showcasing live data updates across check-ins, scoring, and leaderboard updates.
